

This document will explain how to switch LM's internal database to MySQL from SQLite or vice versa.

- 1.) Open `../licmon.swd/db/config.tcl`
 - * Uncomment MySQL at the top, re-comment SQLite
 - * Change MySQL port to 3407
 - * Change host to "localhost"
- 2.) Run `mysqladmin` from `mysql/bin` folder. Run the command:
`"mysqladmin -u root password lamdb"`
- 3.) **This step is for Windows installations only...**
Open `my.ini` for editing from MySQL root folder...
Comment out "log-bin=logging"
Stop and start MySQL, the easiest way is via the `stop_lamlm.bat` command.
- 4.) Run `vovinit.bat` for windows, or source in `vovrc.sh` for linux (`vovrc.csh` for c shell installations). For windows this is located in the `/rtda/2010.09/winNT/bat` directory, for linux in the `/rtda/2010.09/linux/scripts` directory.
- 5.) `"vovproject enable licmon"`
- 6.) `"vovsql_setup_db -admin root -adminpass lamdb -ropass rtdamgr -rwpass rtdausr -showsql"`
- 7.) `"lmmgr loaddb"`
- 8.) Now you can go into LM and under the admin -> System -> Database tab be sure to check that MySQL is the system's reported database.
