PRESS RELEASE

For immediate release.

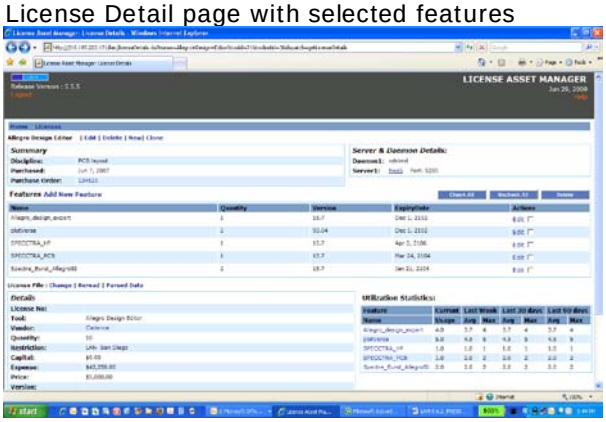
DAC, San Francisco 07/27/09 (Booth 910)

TeamEDA, N. Chelmsford, MA today announces the release of License Asset Manager™ Version 5.6. This new release adds many new features, bug fixes, and completes the major integration with Usage metrics. The main functionality added in this release is the auto-detect and reread of license keys. In doing so the features selected previously during license key parsing, will be preserved and updated when new license keys are mounted. The product detects the new license key and upgrades the feature information, including expiration date and version #. The expiration alert system is then driven off the new date. In addition, the Usage metrics GUI has been improved to provide consistency across the tool.

License Asset Manager tracks assets- Products, Tools that you buy from the vendor. Usage metrics tools monitor feature check-outs/check-ins, and denials. Until now there has been no easy way to map features to Products. LAM has a built-in FLEXlm license parsing tool, which shows all features listed on a license key, or a port@host. The User can then select the features to track for that Product. It may only be one or two features, but that is enough to know if you need more or less Product licenses, Trends, who is using the Product, license denials, etc.

FLEXlm License after parsing

License Detail page with selected features



License Asset Manager™ (LAM) is a comprehensive, enterprise-class management tool to track all EDA engineering software licenses- shared (concurrent-use) and standalone (node and user), across the enterprise, from all EDA Vendors and Resellers. It replaces numerous excel spreadsheets, business cards in the drawer, home-grown access databases, kron jobs to monitor expirations, and any home-grown software used to track these assets. LAM provides a reliable, commercially supported, shared environment for managing these EXPENSIVE assets. COMPLIANCE audits will never be feared since LAM provides all the information necessary to prove compliance. It can provide utilization and denial reports by feature, Product, Site, user, etc. for any time period.

The tool also tracks Vendors, Tools, POs, Costs, License Keys, License Servers, and License daemon information. The information is available to authorized Users, with secured access. The tool can be used to generate any number of License Inventory Reports- by Vendor, by Tool, by License Type (WAN, LAN,….) or by Purchase Type (Perpetual, Subscription, Maintenance only,…),or by Tool discipline. It can also provide "Renewal Cost Estimates" for upcoming Subscriptions or Maintenance, for any Vendor, for any given period of time.

"One of the most important features of License Asset Manager is its ability to track true Expiration dates, and notify appropriate Company people so that a) license service does not get disrupted because a key expires, and b) gives the Company a heads-up to start negotiations and internal paperwork far enough in advance to give the Company an advantage when renewing software licenses, or Maintenance", says Guy Haas, President, TeamEDA.
